

ANNUAL PERFORMANCE REPORT

STATE: GEORGIA

PROJECT NUMBER: _____

STUDY NUMBER: _____

Project Title: Statewide Wildlife Survey

Section Title:

Study Title: Alligator Harvest and Hunt Data in Georgia

Period Covered: July 1, 2014 - June 30, 2015

A. ACTIVITY

Summary:

All alligator harvest report forms were forwarded to the Region VI Game Management Office for analysis. The number of alligators harvested, average length of alligators harvested, longest alligator harvested and hunter success rate were determined by zone and statewide for the 2014 alligator hunting season.

Contents:

Georgia Alligator Hunt Results: 2014-2015

Background:

Alligator hunting provides Georgia sportsmen and sportswomen an opportunity to utilize a sustainable natural resource. Historically, the alligator population reached its lowest point in the late 1960's. This decline was due to inadequately controlled harvests and poaching. Protection derived from the alligator's listing as endangered by the U. S. Fish and Wildlife Service (USFWS) in 1967 and the amended Lacey Act in 1969 resulted in a gradual, but significant increase in the alligator population in Georgia and other southeastern states. This increase led the USFWS to reclassify the alligator to "Threatened by Similarity of Appearance" in 1987. This reclassification allowed states greater flexibility in managing alligators while still maintaining some federal controls on exports of alligator hides. The alligator is now listed as a game animal in Georgia with a legislated harvest season set by the Board of Natural Resources.

Objectives:

To determine the alligator harvest and success rate by zone and statewide in Georgia and determine the method most utilized by hunters.

Procedures:

Hunters are selected by being drawn from quota applications submitted during the summer prior to the hunt season. The selected hunters are issued temporary harvest tags and provided information on hunting zones, alligator hunting techniques, and Georgia alligator hunting rules and regulations. Successful alligator hunters are required to take the alligator hide or the alligator carcass to a Game Management office to have a CITES tag attached in order for them to have the hide tanned, sell the hide, or have the alligator mounted. They are required at that time to fill out an Alligator Harvest Report Form, which includes important hunt data such as date harvested, method utilized, body of water where taken, number of assistants during hunt, length, sex, and weight of alligator.

All Game Management offices are required to forward all alligator harvest report forms to the Alligator Program Coordinator at the Region VI Game Management office for analysis.

B. TARGET DATES FOR ACHIEVEMENT AND ACCOMPLISHMENTS:

Job A.

Goals	Date of Achievement
Annual report – September 1, 2015	November 10, 2014

C. SIGNIFICANT DEVIATIONS:

Completely early

D. FINDINGS:

Job A.

Eleven thousand nine hundred forty-nine (11,949) people applied for the 850 alligator permits available. Applicants were residents of many other states besides Georgia and showed that there was continued national interest in hunting alligators in Georgia.

Alligator hunters were chosen for one of nine different approved hunting zones. The counties in these zones can be seen in the footnotes for Table 1 and ranged from 6 to 16 counties within a zone. The number of counties (86) available for hunting during the 2014 alligator season remained the same as the 2013 season. The number of permits

available varied from zone to zone based on estimated alligator population densities and amount of public water available for hunting and ranged from 60 to 140. The number of alligators harvested per zone ranged from 5 to 55 and can be seen in Table 1. Hunter success rates based on the number of alligators harvested divided by the number of permits available ranged from 7 % (zone 5) to 42 % (zone 7) with an overall success rate of 28 %. The average length of alligators harvested can be seen in Table 1 (100") and ranged from 88" in zone 6 to 117" in zone 2. The longest alligator harvested by zone can also be seen in Table 1 and ranged from 111" to 159". The most popular method of hunting and harvesting alligators was with archery equipment followed second by the use of a snag hook. The percentage of males in the harvest was 65. Comparisons of the previous eleven seasons can be seen in Table 2. The percent success for the eleven seasons is much lower than anticipated with a combined success rate of 31%. Comparisons between zones can be seen in Tables 3-10. The zones with the lowest overall success rate are zones 4 and 5 (18-19%) and the zones with the highest overall success rates are zones 1 and 7 with 39% success. These rates can probably be attributed to the density of alligators within the zones and the amount of public water available for hunting. The remaining zones have success rates ranging from 22% to 38%. The zone with the longest average length is zone 1 at 108" and the zone with the shortest average is zone 4 with an overall 93" average. All other information concerning zone comparisons by year can be seen in tables 3-10.

Analysis of successful hunters' harvest forms shows the average for days hunted was three with a minimum of one day and maximum of sixteen days hunted. The average number of assistants accompanying the hunter was two with a minimum of zero assistants and a maximum of seven. Chart 1 shows the disposition of alligator hides from the 2014 season. Chart 2 shows the percentage of alligators harvested on public (90%) versus private (10%) lands during the 2014 season.

E. RECOMMENDATIONS:

Annual alligator harvest data is needed for continued management of Georgia's alligator resource and annual analysis and yearly comparisons should continue.
